

— BUILD THE RIGHT THING

**Before you spend
\$20,000 on a SaaS
build, spend 5 days
on this.**

The Blueprint week, one step per slide.

Most SaaS budgets don't die in the code. They die in the **scope**.

Features nobody asked for. Screens nobody opens. Weeks nobody planned for.

01

One user. One problem.

Not "small businesses." One person, one painful task, one moment they would pay to fix it.

02

Map the **core loop**

The one action users repeat every week.
Everything else supports it or waits for v2.

03

Write down what's **cut**

A "not in v1" list stops scope creep before it starts. It's the most useful page in the plan.

04

Click it **before** you build it

Build a clickable prototype of the key screens.
Fixing a mockup takes hours. Fixing shipped
code takes weeks.

05

Give AI a job **and a cap**

Use AI only where it saves real time. Cap the cost per user so busy months stay profitable.

— SAVE THIS FOR YOUR NEXT BUILD

Plan in **5 days**. Then build to a fixed price and date.

- ✓ One user, one problem, one core loop
- ✓ A written list of what's cut from v1
- ✓ A prototype you've clicked through
